

Choose how you will weigh your cattle: alley or squeeze chute

Permanent installation (under a squeeze chute)

The load bars/cells are bolted to concrete and either bolted to the squeeze chute directly or through a bracket (depends on chute). Note that though the brackets must be bolted to concrete, the chute itself does not have to be mounted in concrete. This installation process can be involved as it also requires lifting of the chute during the installation process.

Products include:

- HD850 load bars
- HD1010 load bars
- XHD2 load cells

Brackets, if needed, are additional cost. Range from \$125 to \$335

Portable installation (under a platform in an alley):

The load bars are bolted to either an aluminum Tru-Test platform or a custom/ranch-made platform. This platform is generally placed in an alley near a head gate or squeeze chute. Installation is easy... simply use the included bolts and bolt the load bars to the platform through the platform's pre-drilled holes. The system is light enough that two adults can move it around. The portable installation is popular among small herd producers due to cost and ease of installation. Also, ranches with multiple locations appreciate the ease in moving the weighing system between the various locations.

Products include:

- MP600 load bars (for 24" wide platforms)
- MP800 load bars (for 34" wide platforms)

Choose your platform width (portable installations only)

Tru-Test weighing platforms are available in two sizes. It's important to measure the width of your alley to ensure the alley is wide enough for the platform while also not being too wide and allowing animals to step around the platform.

Each platform includes pre-drilled holes for attaching load bars as well as an attached rubber mat to minimize slipping. Model numbers conveniently match to ensure you select the right load bars for the right platform (eg. AP600 and MP600, AP800 and MP800).

Products include:

- AP600 Platform (24" wide)
- AP800 Platform (34" wide)
